

## GE Healthcare Milwaukee, Wisconsin

### The Challenge

To develop a case for the field service team of GE Healthcare (GEHC) for installation, repair, and maintenance of MRI systems. GE Healthcare needed a provider for the complete tool kit solution including design of the case, sourcing of the tools and supplies, and providing worldwide logistics. The cases needed to safely and securely store multiple tools and instruments needed for the repair and upgrade of multimillion-dollar computer tomography systems. The cases needed to be field-deployable, wheel-transportable, shippable, and easy for the field technicians to use on site.

### The Solution

Utilizing a standard Hardigg case, Cases-Cases designed, prototyped, and fielded a rotationally-molded, rolling shipping case with a custom foam interior to accommodate GE's tool kit. The internal foam system was designed with cross-link polyethylene foam. All cavities were designed for easy inventory of kit components and protection of the high-value contents. Working with GEHC and 5 approved vendors for the kit components, Cases-Cases procured all of the case components, integrated the components into the case, and shipped the cases to GE facilities worldwide.

*"To date we have fielded over 250 kits worldwide without a single failure or missed shipment. Cases-Cases has been great to work with. We use them for all of our field service kits."*

—Mike Richards, GE Healthcare
